

Jeeves e-Post

Jeeves e-Post is designed for companies that handle many invoices and depend on a steady cash-flow. To manually handle invoices involves many time-consuming work tasks such as printing, putting into envelopes, stamping and distributing.

Jeeves e-Post is a system for electronic invoicing using the Postal Service's e-Post. Invoice administration becomes less costly thanks to all the above work tasks being done by the Postal Service instead of by your staff. Jeeves e-Post is different from most other systems on the market since it provides the possibility to design your own invoices using a design tool. It is also possible to control invoice design for different customer groups and even language groups.

All information about the customer and order in the ERP system can be used in the invoice. Besides ordinary invoices, the system can also handle order acknowledgements, collective invoices and interest invoices.

Fully electronic invoicing:	A fully electronic invoice management system saves a significant amount of time. It eliminates all in-house printing, putting into envelopes and distribution.
Faster invoicing process:	Invoicing can be done more often, which implies a more steady cash-flow.
Built-in design tool:	Since the appearance of documents can be changed, the company can change without a lot of expense for changing invoice templates.
Customized templates:	High level of customer service thanks to customization of invoices per customer category, customer and language. This is done easily and without any extra administration.
Several different document types:	Choose whether you want to print out an invoice, an interest invoice, collective invoice or an order acknowledgement. This means that a higher percentage of documents can be taken care of by the Postal Services, which means better prices from the Post Office. It also means lower material costs and less wear and tear on your printing equipment.
