

Jeeves EDI is created for companies who require highly-efficient EDI communication. The EDI module is built on a general platform, which means that we can offer a very competitive price.

Identification, unpacking, validation and storage of incoming messages are handled automatically. Even outgoing messages are handled automatically. The solution handles most of the recurring message types within a company's logistics flow.

Supports most existing message types:	Provides wide use without doubling the work and without the risk that something has been distorted on the way.
Good architecture:	Jeeves EDI is based on technology from among others, Inobiz, who is the market leader within EDI and integration products. Since it is built on a general foundation, there is less need for consultation at start-up and when adding new messages.
EDI-server, Jeeves Message Broker:	Since Jeeves EDI is built on a general message engine which can also handle message types other than EDI, the same product can be used in many places within Jeeves, for example e-Approval and e-Procurement. This means significantly lower investment costs.
Automatic syntax conversion:	The EDI information is translated to posts within a table and is then available for further processing. This is an efficient way to handle syntax conversion.
Defined partner profiler – customer customization:	High level of automation since one can treat each partner and message type in a unique way.
Alarm via mail:	Full support to customize alarm and information functionality to suit the business. Each partner and message type can be handled in a unique way.
Original message stored and can be analysed later:	Makes it safe and reliable to set up the system, since it's easy to check that the rule set has been set up correctly.
Pre-system manages and checks before the information becomes active in the database:	Security and verification since one can validate, activate, compare and create.

**Automation to control
message receipts:**

It's easy to follow up which receipts have been issued, which means greater security and good verification.
