

“Well packaged for a good price. The Business Intelligence was quickly up and running without straining the IT-department too much.”

“We are saving a day per month due to the simplicity of getting sales statistics.”

“Now, we can easily see why our gross margin is very good one month!”

JEEVES BUSINESS INTELLIGENCE – WHY?

All entrepreneurs need to quickly obtain reports and analysis for decision making actions. With Jeeves Business Intelligence you can easily make the correct decision at the right time.

Jeeves Business Intelligence is a prepackaged decision support system that compiles transactions from different parts of the ERP-system into relevant information in order to help you better understand and develop your business.

JEEVES BUSINESS INTELLIGENCE – FOR WHOM?

Jeeves Business Intelligence is addressed to distributing, manufacturing and service producing companies that needs to rationalize their business processes by identifying reasons for different results, monitor critical activities and successfully work with a goal driven business.

JEEVES BUSINESS INTELLIGENCE – HOW?

With easily understood and interpreted tables and charts, Jeeves Business Intelligence provides a constantly updated overview of the business, including sales, purchasing, inventory and financials. This overview can, with simple methods, be filtered and angled from different dimensions and also be broken down to a detailed level to highlight various perspectives.

For instance, you can in a single chart see the billed value, gross margin and ratio per customer, customer category, item, item category or seller. The chart can then be filtered on the dimensions customer, seller and inventory location and different concepts of time, item and region.

With luminous graphics, Jeeves Business Intelligence compares the business development over time and deviations on critical key values as sales growth, credit times, delivery precision and stock turnover can be pointed out. With a drill down functionality it is possible to drill all the way down to a transaction level in order to trace the reason for a deviation.

Jeeves Business intelligence is easy to adapt. It is easy to add own charts or change the charts on existing analysis. It is also possible to add other fields from the ERP-system as filter or dimensions in the charts. All of this in order to show the information in a way that suits your company the best.

As opposed to many other Business Intelligence offers, Jeeves BI is a finished application with finished dimensions that allows analyzing without having to build a data warehouse.

Prepackaged	Makes advanced activity monitoring possible without having to involve your IT-department.
Complements the ERP-System	Aggregates the transaction data in analysis that is not included as standard in the ERP-system. This provides a greater value with the ERP-system.
Clickable interface	Queries and filtering is easily performed with a clickable interface. No costly education is needed to get started.
Quick overview	Clear images with smart graphics that show relevant connections based on daily information. The correct decision is quickly made.
Validation data	Access to transaction rows that can automatically be exported to Excel. Provides trust in the application, which leads to quicker decision making.
Drill down	Images that provide an overview can be broken down to transaction level. This leads to shorter investigations through faster tracking of the reasons for the deviation.
Adaptable, same as the ERP-system	Fields made by you in Jeeves can be added as filters or dimensions. The business follow-up can be naturally adapted same as the business development.
Multi company handling	This is a cost efficient tool for the management since companies in the same group can be compared to each other in the same chart.
Function divided account analysis based on rolling periods	A comparison of current account balance or predefined account group level, towards previous year with rolling periods. Provides a continuous control of how the business is doing from a functional perspective.
Graphic margin analysis	Comparing turnover to margin on a customer level, all the way down to month-by-month. Shows what customers are profitable, what items they purchase, who has potential and who should be settled.
Liquidity prognosis	A line graph showing the sum of reserves, supplier invoices and customer receivables on a weekly basis provides an immediate overview over the future liquidity.
Credit analysis	The turnover is compared to credit on a customer level. Shows customers with a large turnover but with a long credit time that comes with a high cost of credit
Monitoring incoming deliveries	The number of late incoming deliveries, from manufacturing or purchasing, showed totally or per inventory location, item group or item helps expose bottlenecks regarding incoming deliveries.
Stock-level trends	A bar graph showing inventory level or value per item, item class or inventory location on a monthly basis. Shows how the bound capital has varied over time.
Supplier monitoring	A meter showing delivery precision regarding time, quantities and quality per supplier. Provides clear warning signs and a great basis for renegotiating delivery terms.
